

## Systems Simulation Chapter 7: Random-Number Generation

Fatih Cavdur  
fatihcavdur@uludag.edu.tr

April 22, 2014

### Introduction

- Random Numbers (RNs) are a necessary basic ingredient in the simulation of almost all discrete systems.
- Most computer languages have a subroutine, object or function that generates a RN.
- Similarly, simulation languages generate RNs that are used to generate event times and other random variables.
- We will look at the generation of RNs and some randomness tests in this chapter. Next chapter will show how we can use them to generate RVs.

## Properties of RNs

- A sequence of RNs,  $R_1, R_2, \dots$ , must have two important statistical properties: uniformity and independence.
- Each RN,  $R_i$  must be an independent sample drawn from a continuous uniform distribution between 0 and 1.

$$f(r) = \begin{cases} 1, & 0 \leq r \leq 1 \\ 0, & \text{otherwise} \end{cases}$$

$$E(R) = \int_0^1 r dr = \frac{1}{2}$$

$$V(R) = E(R^2) - [E(R)]^2 = \frac{1}{12}$$

## Properties of RNs

### Some Consequences of Uniformity and Independence

- If the interval  $[0, 1]$  is divided into  $n$  classes (sub-intervals) of equal length, the expected number of observations in each interval is  $N/n$ , where  $N$  is the total number of observations.
- The probability of observing a value in a particular interval is independent of the previous values drawn.

## Generation of Pseudo-RNs

### Problems and Errors

- Numbers might not be uniformly distributed.
- Numbers might be discrete-valued.
- The mean / variance of the generated numbers might be too high or too low.
- There might be dependence, such as,
  - autocorrelation
  - numbers successively higher or lower than adjacent numbers
  - several numbers above the mean followed several numbers below the mean

## Generation of Pseudo-RNs

### Important Considerations

- The routine should be fast.
- The routine should be portable.
- The routine should have a sufficiently long cycle.
- The RNs should be replicable (repeatable).
- Most importantly, the generated RNs should closely approximate the ideal statistical properties of uniformity and independence.

## Linear Congruential Method

- The linear congruential method (LCM) produces a sequence of integers,  $X_1, X_2, \dots$  between 0 and  $m - 1$  by following a recursive relationship.

$$X_{i+1} = (aX_i + c) \bmod m, \quad i = 0, 1, 2, \dots$$

$$R_i = \frac{X_i}{m}, \quad i = 1, 2, \dots$$

- The initial value  $X_0$  is called the seed,  $a$  is called the multiplier,  $c$  is the increment and  $m$  is the modulus.
- If  $c = 0$ , it is known as the *multiplicative congruential method*, and if  $c \neq 0$ , it is called as the *mixed congruential method*.

## Linear Congruential Method

### Example

- Use the LGM to generate a sequence of RNs with  $X_0 = 27$ ,  $a = 17$ ,  $c = 43$  and  $m = 100$ .

$$X_0 = 27$$

$$X_1 = (17 \times 27 + 43) \bmod 100 = 2 \Rightarrow R_1 = \frac{2}{100} = 0.02$$

$$X_2 = (17 \times 2 + 43) \bmod 100 = 77 \Rightarrow R_2 = \frac{77}{100} = 0.77$$

$$X_3 = (17 \times 77 + 43) \bmod 100 = 52 \Rightarrow R_3 = \frac{52}{100} = 0.52$$

## Linear Congruential Method

### Properties to Consider

- Generated numbers must be approximately uniform and independent.
- Moreover, other properties, such as *maximum density* and *maximum period* must be considered.
- By maximum density is meant that the values assumed by  $R_i, i = 1, 2, \dots$ , leave no large gaps on  $[0, 1]$ .
- In many simulation languages, values such as  $m = 2^{31} - 1$  and  $m = 2^{48}$  are in common use in generators.
- To help achieve maximum density and to avoid cycling, the generator should have the largest possible period.

## Linear Congruential Method

### Properties to Consider

- 1 For  $m$  a power of 2, say  $m = 2^b$ , and  $c \neq 0$ , the longest possible period is  $P = m = 2^b$ , which is achieved whenever  $c$  is relatively prime to  $m$  (the greatest common factor of  $c$  and  $m$  is 1) and  $a = 1 + 4k$ , where  $k$  is an integer.
- 2 For  $m$  a power of 2, say  $m = 2^b$ , and  $c = 0$ , the longest possible period is  $P = m/4 = 2^{b-2}$ , which is achieved if the seed  $X_0$  is odd and if the multiplier  $a$ , is given by  $a = 3 + 8k$  or  $a = 5 + 8k$ , for some  $k = 0, 1, \dots$
- 3 For  $m$  a prime number and  $c = 0$ , the longest possible period is  $P = m - 1$ , which is achieved whenever the multiplier,  $a$ , has the property that the smallest integer  $k$  such that  $a^k - 1$  is divisible by  $m$  is  $k = m - 1$ .

## Linear Congruential Method

### Properties to Consider-Example 1

Using the multiplicative LCM, find the period of the generator for  $a = 13$ ,  $m = 2^6 = 64$  and  $X_0 = 1, 2, 3, 4$ . When the seed is 1 or 3, the sequence has a period of 16. Period lengths of 8 and 4 is achieved when the seed is 2 and 4, respectively. In this example,  $m = 2^6 = 64$  and  $c = 0$ . The max period is then  $P = m/4 = 16$ .

Table : Periods for Various Seeds

$i$	$X_i$	$X_i$	$X_i$	$X_i$
0	1	2	3	4
1	13	26	39	52
2	41	18	59	36
3	21	42	63	20
4	17	34	51	4
5	29	58	23	52
6	57	50	43	36
7	37	10	47	20
8	33	2	35	4

## Linear Congruential Method

### Properties to Consider-Example 2

With  $a = 13 = 1 + 4 \times k = 1 + 4 \times 3$ ,  $c = 3$  is relatively prime to  $m = 16$  and  $X_0 = 1$ , we have the following sequence with the max period of  $P = m = 2^b = 2^4 = 16$ :

Table : Max Period

$i$	$X_i$	$i$	$X_i$
1	0	9	8
2	3	10	11
3	10	11	2
4	5	12	13
5	4	13	12
6	7	14	15
7	14	15	6
8	9	16	1

## Linear Congruential Method

### Properties to Consider-Example 3

With  $a = 3$ ,  $c = 0$ , prime number  $m = 17$  and  $X_0 = 1$ , we have the following sequence with the max period of  $P = m - 1 = 16$  when  $k = 16$  is the smallest integer such that  $a^k - 1 = 3^{16} - 1$  (which equals to 43,046,720) is divisible by  $k = m - 1 = 16$  (verify that for  $k < 16$ ,  $a^k - 1$  is not divisible by  $k = m - 1$ ):

Table : Max Period

$i$	$X_i$	$i$	$X_i$
1	3	9	14
2	9	10	8
3	10	11	7
4	13	12	4
5	5	13	12
6	15	14	2
7	11	15	6
8	16	16	1

## Combined Linear Congruential Generators

- A RNG with a period of  $2^{31} - 1 \approx 2 \times 10^9$  is no longer adequate due to the increasing complexity. So, combine two or more multiplicative congruential generators in such a way that the combined generator has good statistical properties and a longer period.
- If  $W_{i1}, W_{i2}, \dots, W_{ik}$  are any independent, discrete-valued RVs (not necessarily identically distributed), but one of them, say  $W_{i1}$ , is uniform on the integers from 0 to  $m_1 - 2$ , then, the following is uniform on the integers from 0 to  $m_1 - 2$ .

$$W_i = \left( \sum_{j=1}^k W_{ij} \right) \mod m_1 - 1$$

## Combined Linear Congruential Generators

- Let  $X_{i1}, X_{i2}, \dots, X_{ik}$  be the  $i$ th output from  $k$  different multiplicative congruential generators.

$$X_i = \left( \sum_{j=1}^k (-1)^{j-1} X_{ij} \right) \mod m_1 - 1$$

$$R_i = \begin{cases} \frac{X_i}{m_1}, & X_i > 0 \\ \frac{m_1-1-X_i}{m_1}, & X_i = 0 \end{cases}$$

- The maximum period is given by

$$P = \frac{(m_1 - 1)(m_2 - 1) \dots (m_k - 1)}{2^{k-1}}$$

## Combined Linear Congruential Generators

Algorithm by L'Ecuyer (1998)

- Step (1)** Select seed  $X_{1,0}$  in the range  $[1, 2, 147, 483, 562]$  for the first generator, and seed  $X_{2,0}$  in the range  $[1, 2, 147, 483, 398]$  for the second. Set  $j = 0$ .

- Step (2)** Evaluate each individual generator.

$$X_{1,j+1} = 40,014X_{1,j} \mod 2,147,483,563$$

$$X_{2,j+1} = 40,692X_{2,j} \mod 2,147,483,399$$

- Step (3)** Set

$$X_{j+1} = (X_{1,j+1} - X_{2,j+1}) \mod 2,147,483,562$$

## Combined Linear Congruential Generators

Algorithm by L'Ecuyer (1998)

Step (4) Return

$$R_{j+1} = \begin{cases} \frac{X_{j+1}}{2,147,483,563}, & X_{j+1} > 0 \\ \frac{2,147,483,562 - X_{j+1}}{2,147,483,563}, & X_{j+1} = 0 \end{cases}$$

Step (5) Set  $j = j + 1$  and go to step 2.

## RN Streams

- The seed for a LCG is the integer value  $X_0$  that initializes the RN sequence.
- Any value in the sequence  $X_0, X_1, \dots, X_P$  could be used to “seed” the generator.
- A RN *stream* is a convenient way to refer to a starting seed taken from the sequence.
- Typically these starting seeds are far apart in the sequence. If the streams are  $b$  values apart, then, stream  $i$  could be defined by starting seed  $S_i = X_{b(i-1)}$ , for  $i = 1, 2, \dots, \lfloor P/b \rfloor$ .
- Values of  $b = 100,000$  were common in older generators, but values as large as  $b = 10^{37}$  are in use in modern combined LCGs.

## Tests for RNs

- To check on whether the desirable properties of uniformity and independence, a number of tests can be performed.
- The tests can be placed in two categories, according to the properties of interest: uniformity and independence.
- Frequency Test: Uses the Kolmogorov-Smirnov or the chi-square test to compare the distribution of the set of numbers generated to a uniform distribution.
- Autocorrelation Test: Tests the correlation between numbers and compares the sample correlation to the expected correlation, zero.

## Tests for RNs

- In testing for uniformity, the hypotheses are as follows:

$$H_0 : R_i \sim U[0, 1]$$

$$H_1 : R_i \not\sim U[0, 1]$$

- In testing for independence, the hypotheses are as follows:

$$H_0 : R_i \sim \text{independently}$$

$$H_1 : R_i \not\sim \text{independently}$$

## Frequency Tests

### Kolmogorov-Smirnov (K-S) Test

- This test compared the continuous CDF,  $F(x)$ , of the uniform distribution with the empirical CDF,  $S_N(x)$ . We have

$$F(x) = x, \quad 0 \leq x \leq 1$$

- The empirical CDF  $S_N(x)$  defined by

$$S_N(x) = \frac{\text{number of } R_1, R_2, \dots, R_N \text{ which are } \leq x}{N}$$

- K-S test is based on the largest absolute deviation between

$$D = \max |F(x) - S_N(x)|$$

## Frequency Tests

### K-S Test

**Step (1)** Rank the data from smallest to largest. Let  $R_{(i)}$ , denote the  $i$ th smallest observation.

**Step (2)** Compute

$$D^+ = \max \left\{ \frac{i}{N} - R_{(i)} \right\}$$

$$D^- = \max \left\{ R_{(i)} - \frac{i-1}{N} \right\}$$

## Frequency Tests

### K-S Test

- Step (3) Compute  $D = \max(D^+, D^-)$
- Step (4) Locate in Table A.8 the critical value  $D_{\alpha, N}$ .
- Step (5) If  $D > D_{\alpha, N}$ , the null hypothesis is rejected. If  $D \leq D_{\alpha, N}$ , conclude that no difference has been detected between the distributions.

## Frequency Tests

### K-S Test Example

- Suppose that we have five numbers, 0.44, 0.81, 0.14, 0.05 and 0.93. Perform a test for uniformity using the K-S test with the significance level of  $\alpha = 0.05$ .
- We must first rank the numbers from smallest to largest. The calculations are seen in the table on the next slide.
- The computations for  $D^+$  and  $D^-$  are shown as  $i/N - R_{(i)}$  and  $R_{(i)} - (i - 1)/N$ , respectively.
- We see that  $D^+ = 0.26$ ,  $D^- = 0.21$ ,  $D = 0.26$  and  $D_{\alpha, N} = 0.565$ . Since  $D < D_{\alpha, N}$ , the hypothesis that the distribution is uniform distribution is not rejected.

## Frequency Tests

### K-S Test Example

Table : Calculations for K-S Test

$R_{(i)}$	0.05	0.14	0.44	0.81	0.93
$i/N$	0.20	0.40	0.60	0.80	1.00
$i/N - R_{(i)}$	0.15	0.26	0.16	-	0.07
$R_{(i)} - (i-1)/N$	0.05	-	0.04	0.21	0.13

## Frequency Tests

### K-S Test Example

Figure : Comparison of  $F(x)$  and  $S_N(x)$

## Frequency Tests

### Chi-Square (C-S) Test

- The C-S test uses the sample statistic

$$\chi_0^2 = \sum_{i=1}^n \frac{(O_i - E_i)^2}{E_i}$$

- $O_i$  and  $E_i$  are the observed and expected number in class  $i$ .  
For equally spaced classes,

$$E_i = \frac{N}{n}$$

- It can be shown that  $\chi_0^2$  is approximately chi-squared distributed with  $n - 1$  degrees of freedom.

## Frequency Tests

### C-S Test Example (Example 7.7 in DESS)

Considering the given data the following computations are done. Since  $\chi_0^2 = 3.4 < \chi_{0.05,9}^2 = 16.9$ , the null hypothesis is not rejected.

Table : Calculations for C-S Test

Interval	$O_i$	$E_i$	$O_i - E_i$	$(O_i - E_i)^2$	$\frac{(O_i - E_i)^2}{E_i}$
1	8	10	-2	4	0.4
2	8	10	-2	4	0.4
3	10	10	0	0	0.0
...	...	...	...	...	...
8	14	10	4	16	1.6
9	10	10	0	0	0.0
10	11	10	1	1	0.0
	100	100	0		3.4

## Autocorrelation Tests

- The tests for autocorrelation are concerned with the dependence between numbers in a sequence.
- We will consider a test for autocorrelation. It requires the computation of autocorrelation between every  $m$  numbers ( $m$  is the lag), starting with the  $i$ th number.
- Thus, the autocorrelation  $\rho_{im}$  between the following numbers would be of interest:  $R_i, R_{i+m}, R_{i+2m}, \dots, R_{i+(M+1)m}$ .
- The value  $M$  is largest integer st  $i + (M + 1)m \leq N$ , where  $N$  is the total number of values in the sequence. We have,

$$H_0 : \rho_{im} = 0$$

$$H_1 : \rho_{im} \neq 0$$

## Autocorrelation Tests

- The distribution of the estimator  $\hat{\rho}_{im}$  is approximately normal if the data are uncorrelated. We have the standard normal test statistic of  $Z_0$  and do not reject  $H_0$  if  $-z_{\alpha/2} \leq Z_0 \leq z_{\alpha/2}$ .

$$Z_0 = \frac{\hat{\rho}_{im}}{\sigma_{\hat{\rho}_{im}}}$$

$$\hat{\rho}_{im} = \frac{1}{M+1} \left( \sum_{k=0}^M [R_{i+km}] [R_{i+(k+1)m}] \right) - 0.25$$

$$\sigma_{\hat{\rho}_{im}} = \frac{\sqrt{13M+7}}{12(M+1)}$$

## Autocorrelation Tests

### Autocorrelation Test Example (Example 7.8 in DESS)

Considering the data in the text, we test for whether the 3rd, 8th, 13th and so on, numbers are autocorrelated using  $\alpha = 0.05$ . Here,  $i = 3, m = 5, N = 30$  and  $M = 4$  (largest integer st  $3 + (M + 1)5 \leq 30$ ). Then,

$$\begin{aligned}\hat{\rho}_{im} &= \frac{1}{M+1} \left( \sum_{k=0}^M [R_{i+km}] [R_{i+(k+1)m}] \right) - 0.25 \\ &= \frac{1}{4+1} (.23(.28) + .28(.33) + .33(.27) + .27(.05) + .05(.36)) - 0.25 \\ &= -0.1945\end{aligned}$$

## Autocorrelation Tests

### Autocorrelation Test Example (Example 7.8 in DESS)

$$\sigma_{\hat{\rho}_{im}} = \frac{\sqrt{13M+7}}{12(M+1)} = \frac{\sqrt{13(4)+7}}{12(4+1)} = 0.1280$$

$$Z_0 = \frac{\hat{\rho}_{im}}{\sigma_{\hat{\rho}_{im}}} = -\frac{0.1945}{0.1280} = -1.516$$

Since  $-z_{0.025} = -1.96 \leq Z_0 \leq 1.96 = z_{0.025}$ , we cannot reject the null hypothesis.

## Summary

- Reading HW: Chapter 7.
- Chapter 7 Exercises.
